

# Course Project Report

By: Eilaf Aljundi

N01486732

The goal of the project is to build a website that will consist of 6 pages:

- Home page
- Projects page
- Hobbies page
- Experience page
- Contact page
- About page

## Home Page

The home page will act as a welcome to the site visitors. This page will include the **audio** element.

## Projects Page

The projects page will include all the projects that I have done since I started learning programming. All the projects that are shown here are done using **Javascript**.

## Hobbies Page

This page will include all of my hobbies that I like to do in my free time. This page also contains the **video** element as well as an unordered list and some pictures.

## Experience Page

In this page I will talk about my experience with programming. How I started, why I loved it, what I have done with it, and where I plan to go with it. In this page I will incorporate some **JQuery** to show and hide text.

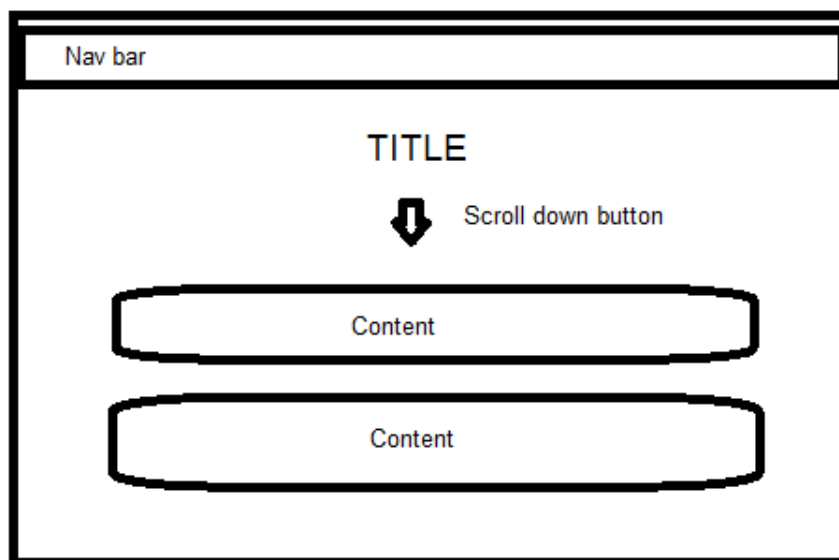

## Contact Page

This page will have a **form** that handles the user's input. Contact page will have a first name input field, as well as last name, email, message, and a send button.

## About Page

This page will talk about the website itself and why it was started/made.

## Pages design concept:

## CSS Style Sheet:

The project will have a CSS style sheet that handles all the styling for the website.

## Scripts Sheet:

There is a file for the Javascript used in the website. However, JQuery is not on its own file because it was only used on one page and so I put it in the head of that page.
